

AMENDMENTS TO THE SPECIFICATION

Paragraph [0011] contains a misspelled word. Please replace paragraph [0011] with the following amended paragraph:

[0011] The managed system and methods of the present invention are segmented into 3 main areas: Clouds, Registrations, and Resolvers. The cloud object provides information about the clouds that are available. If a ~~could~~ cloud is available, the Registration object can be used to register endpoints with the P2P name resolution protocol. Finally, if an application developer wishes to resolve a peer name to an IP address, they simply use the resolver object. The clouds may be monitored for state changes in one embodiment of the present invention through a cloud watcher object.

Paragraph [0071] contains a typographical error for a reference number. Please replace paragraph [0071] with the following amended paragraph:

[0071] Clouds 230 are monitored for state change via the CloudWatcher object 242. It is important to note that for each scope only, one CloudWatcher object 242 should be needed, as a single CloudWatcher object 242 monitors all clouds ~~330~~ 230. In order to monitor clouds using a CloudWatcher object 242, a developer must simply construct a cloud watcher object and assign the appropriate event handler, such as illustrated in Table 4, below.
